EDUCATION

University of Indonesia

Bachelor of Computer Science

Depok, Indonesia

2023 – Present

EXPERIENCE

Research Intern

Faculty of Computer Science, University of Indonesia

MLCV Laboratorium

Feb 2026 – Present

- Built an ECG digitization pipeline converting paper 12-lead ECG scans into aligned time-series signals, and trained deep learning models (1D ResNet, InceptionTime, CNN-BiLSTM-Attention) to classify mitral valve disease from the digitized signals.
- Productionized the research into PRECIA, a clinical AI platform for cardiology screening: built the mitral-classification FastAPI microservice end-to-end and the cross-cutting AI Registry feature spanning the Django backend and Next.js frontend.

Undergraduate Teaching Assistant

Faculty of Computer Science, University of Indonesia

Course: Programming Foundations 2

Feb – Jun 2025

- Explained and designed tasks around core programming concepts, including Object-Oriented Programming principles (encapsulation, inheritance, polymorphism, abstraction) using Java.

Software Engineering Staff

COMPFEST 17

Apr – Nov 2025

- Developed a large-scale full-stack event platform using React Router v7, NestJS, Prisma, and PostgreSQL with structured multi-program modules (Grand Launching, Academy, Competition, Xcelerate, Virtual Playground), including gamification systems to improve participant engagement.
- Implemented scalable RESTful APIs with NestJS, including JWT authentication, guard-based middleware, AWS S3 integration, and database schema design using Prisma ORM.

Community Service Department Staff

University of Indonesia

Student Executive Board – Faculty of Computer Science

Jun 2024 – Jan 2025

- PIC of “PEDAS,” a fundraising program supporting the education of children of faculty staff (canteen workers, janitors, security personnel).

PROJECTS

Vessel | *React, Next.js, Tailwind CSS, Rust, Solidity, Docker*

Dec 2025 – Mar 2026

- Designed a hybrid Web2/Web3 architecture with “On-Chain Accounting”, bridging fiat (IDR) with blockchain transparency for a trade finance application (Rust backend + Next.js 15/TypeScript) on Base Network.
- Delivered the investor funding flow (investment modal, wallet balance display), admin KYC/business-verification dashboard, and dynamic KYC-status logic for the exporter dashboard, plus backend funding-flow and error-handling fixes around invoice approval and on-chain shipment verification.

VigilNet | *React, Vite, Fastify, TypeScript, Capacitor*

2025

- Contributed to an event-safety/SOS platform where participants pair to an event via a mobile app and send precise-location SOS alerts monitored in real time by organizers.
- Built a BLE peer-to-peer crowd-density detection feature end-to-end (native Android Capacitor plugin with TypeScript bridge), and replaced a placeholder dashboard visualization with a real Leaflet map and density heatmap layer.

ACHIEVEMENTS

TechSprint 2026

1st Runner-up & Best Data Insight Award

Data Automation Competition

- Given three disconnected, messy data sources (POS, warehouse, purchasing), built a vectorized pandas/numpy pipeline with data cleansing and a Modified-Z-score anomaly detector to flag daily per-ingredient stock status and shrinkage, reaching 100% precision / 91.8% recall on restock detection.

SSFUNS 2026 (SSDS Division)

Qualified to Final Round

Data Science Competition

- Forecast water level at 30 stations on the Bengawan Solo river across an 8-month data gap using per-station-group models (LightGBM / ENSO-conditioned climatology) with spatial reconciliation, achieving public RMSE 1.56.
